

# Connect to the Art Lab Phaser From a Laptop on Titan WiFi

If, for reasons of software version mismatches, you want to print to our Xerox Phaser from your laptop, here are the steps you will need to follow after you have authenticated to Titan WiFi. Note: the following instructions assume you are using OS X Mountain Lion or newer. If you aren't running Mountain Lion or newer, go get Mountain Lion or newer.

Go to your System Preferences and choose Print & Scan. Then click the + in the bottom left corner of your Printers list to add a printer. Click the grey sphere to add an IP printer, and then enter the IP address as shown to the right.

You may also want to enter a recognizable name for the printer into the Name field so that you don't have to remember the printer by its IP address.

Your laptop will then go out to the Apple Software Update servers and get the necessary drivers to use the printer. After the drivers have been installed, the printer will be available for use.
